

## How to configure Windows 10 to allow PowerChute Personal Edition to recognize the French Language:

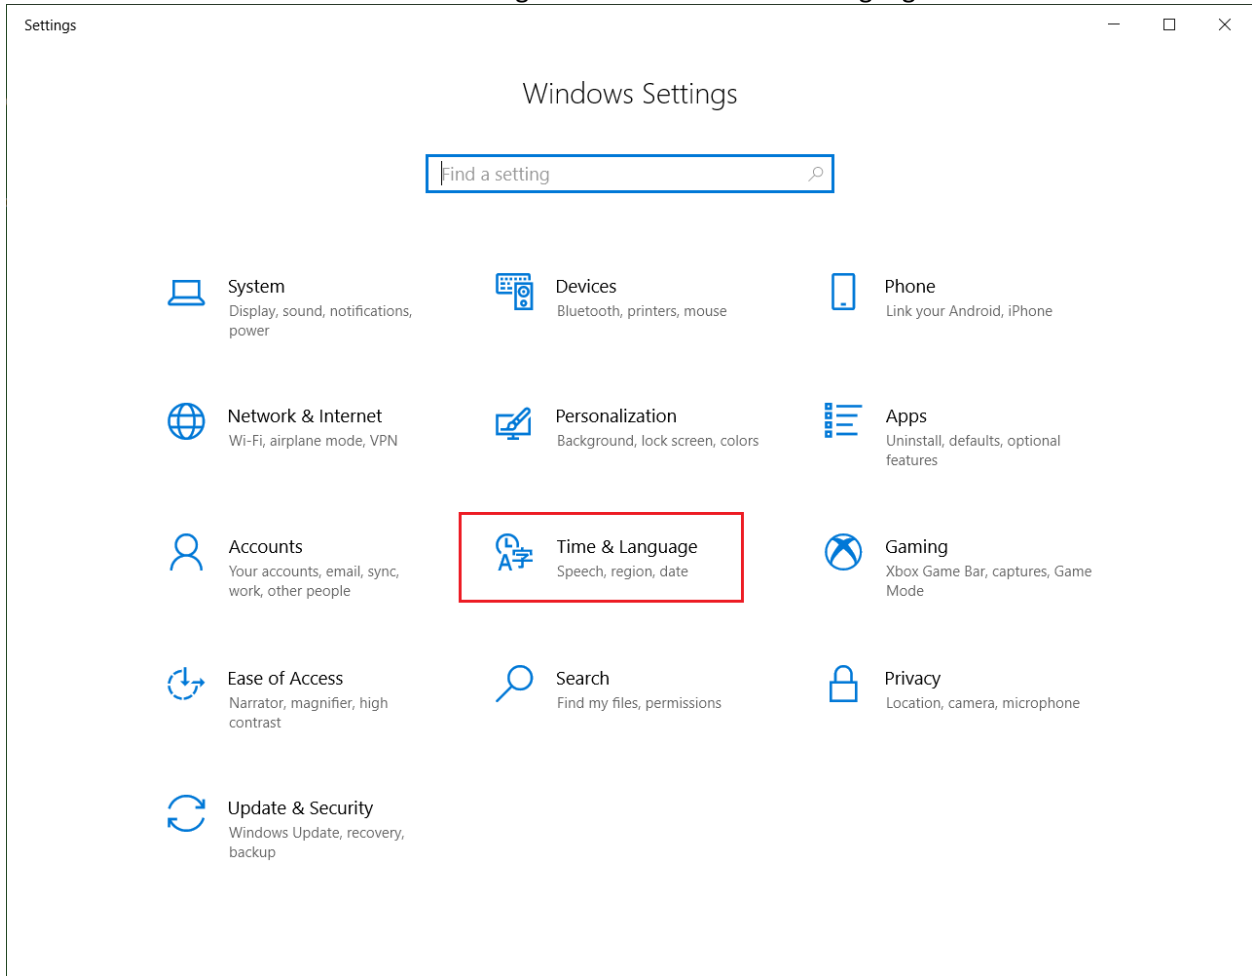

To install PowerChute Personal Edition for a non-English base OS, the OS must be set for the desired Language before PowerChute being installed.

NOTE: To install the French version of PowerChute, the OS must be set to French - France. If the system is set to French - Canada, the program will run in English.

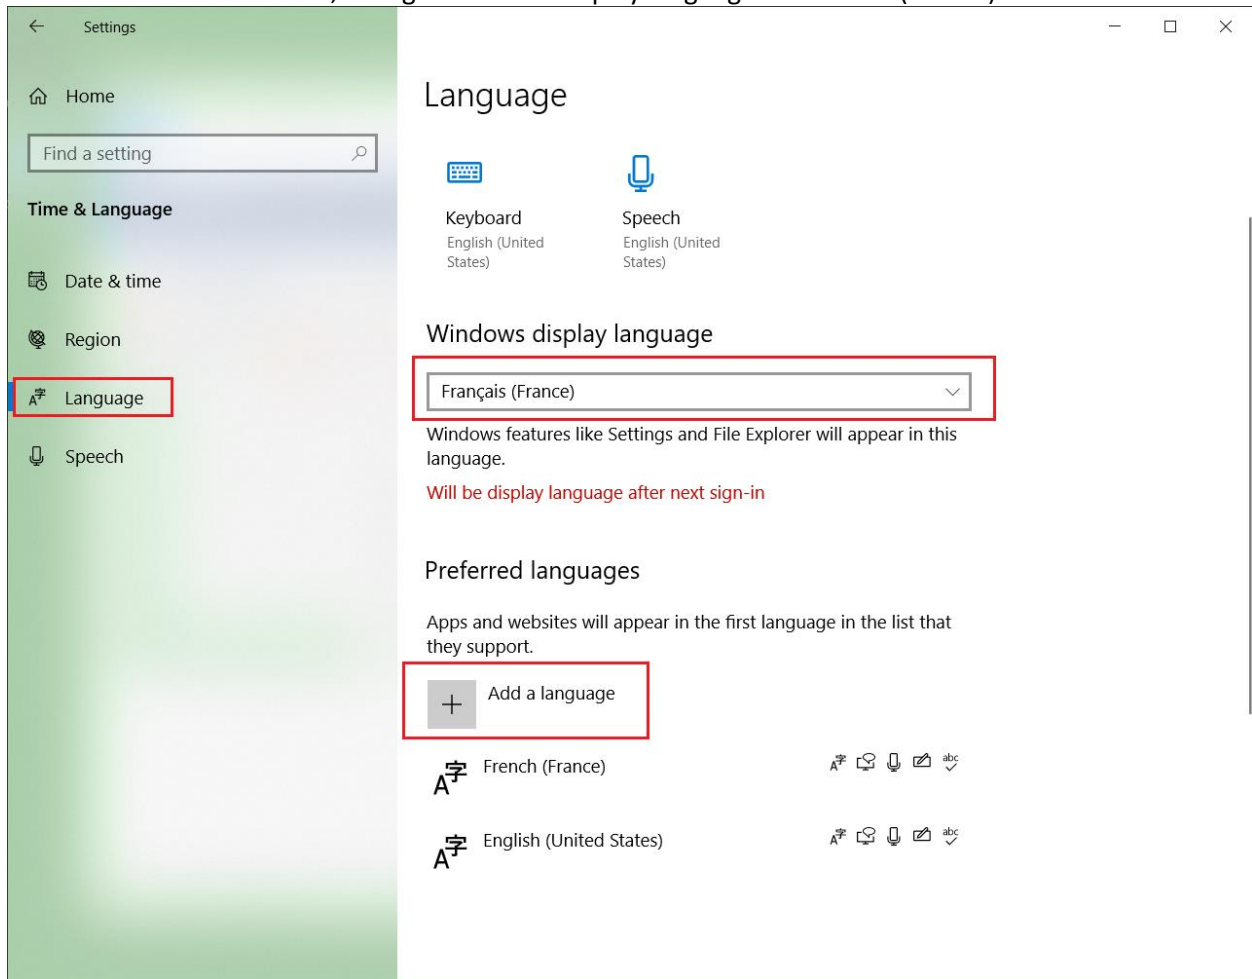

To change the system language settings, from the Desktop, go to Start and select Settings from the Programs menu.

## From the Settings window select Time & Language

From the Time & Language window select Language, click add a Language, select Francais (France).  
Once French has been installed, change Windows Display language to Francais (France)

Next go to Region and verify Country or region equals France, and the Current format is French (France)
